

Tricks with charts in Tableau

**While we're waiting to begin,
please answer in the Zoom chat:**

How are your projects going? 😊

Making charts more interactive

Let the user decide which fields (s)he wants to see in dimensions \ metrics

Step 1. Create Parameter(s) with fields that can be used as a dimension \ metric

The image shows a screenshot of the Tableau interface. On the left, the 'Tableau' menu is open, and the 'Create Parameter...' option is highlighted. A blue arrow points from this option to the 'Edit Parameter [Per_what]' dialog box on the right.

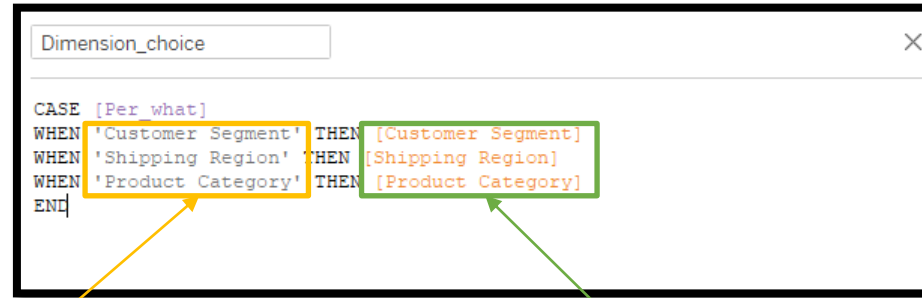

The 'Edit Parameter [Per_what]' dialog box has the following fields and options:

- Name: Per_what
- Comment: >>
- Properties:
 - Data type: String
 - Current value: Product Category
 - Value when workbook opens: Current value
 - Display format:
 - Allowable values: ☐ All ☒ List ☐ Range
- List of values:

Value	Display As
Customer Segment	Customer Segment
Shipping Region	Shipping Region
Product Category	Product Category
Add	

 - ☒ Fixed
 - ☐ When workbook opens
 - Add values from: None

Step 2. Create a Calculated field which would use the parameter with dimension options

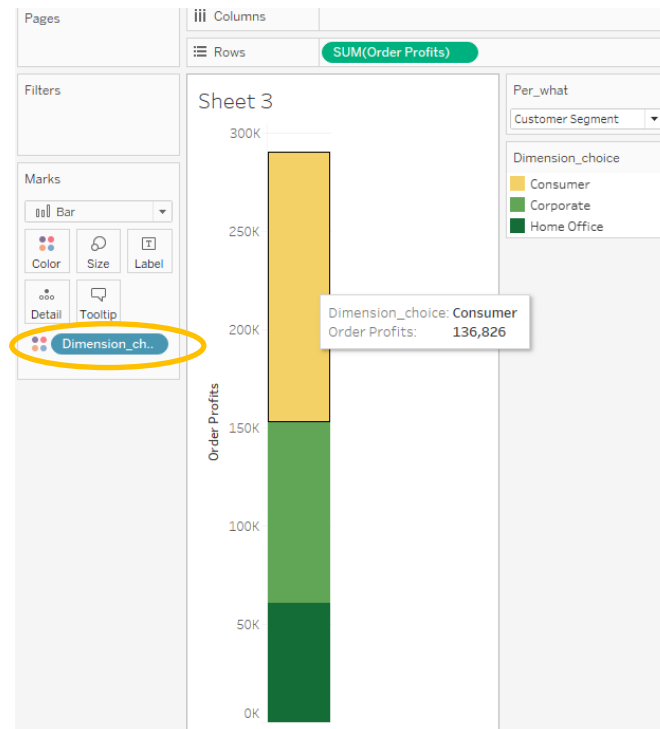

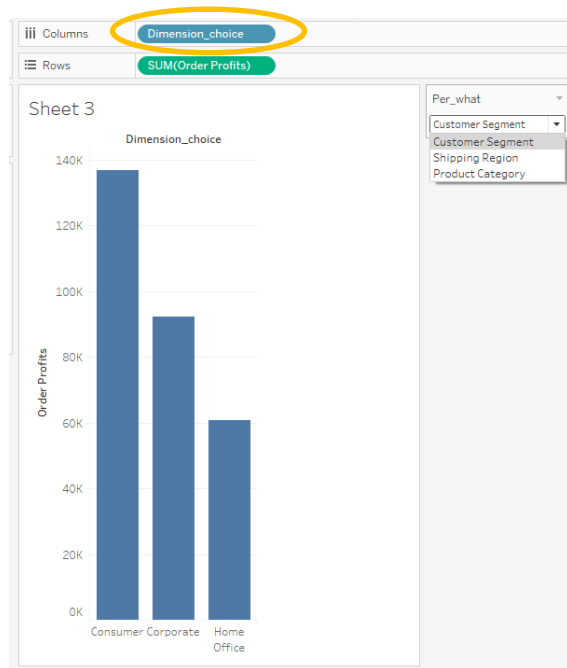

```
Dimension_choice
CASE [Per what]
WHEN 'Customer Segment' THEN [Customer Segment]
WHEN 'Shipping Region' THEN [Shipping Region]
WHEN 'Product Category' THEN [Product Category]
END
```

This is what a user would be choosing when we “Show Parameter” and it would be used as a filter:

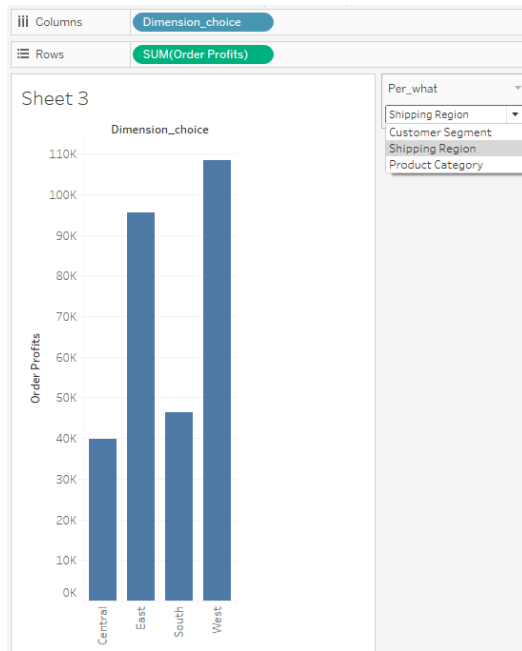

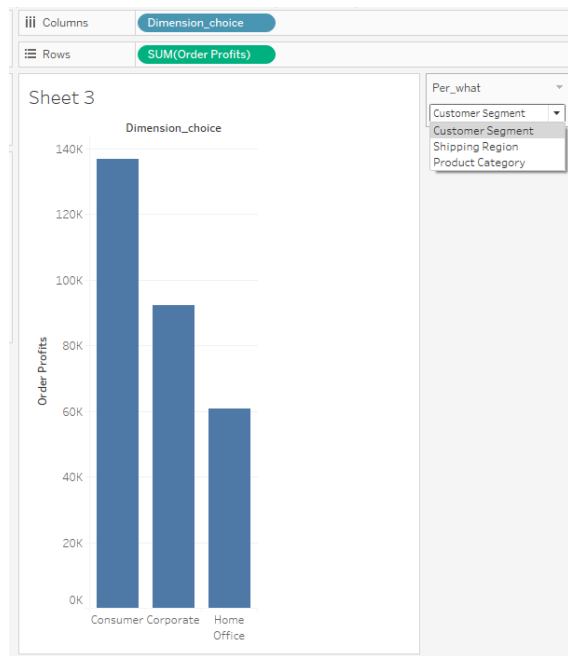

The actual dimensions in your dataset that are going to be used

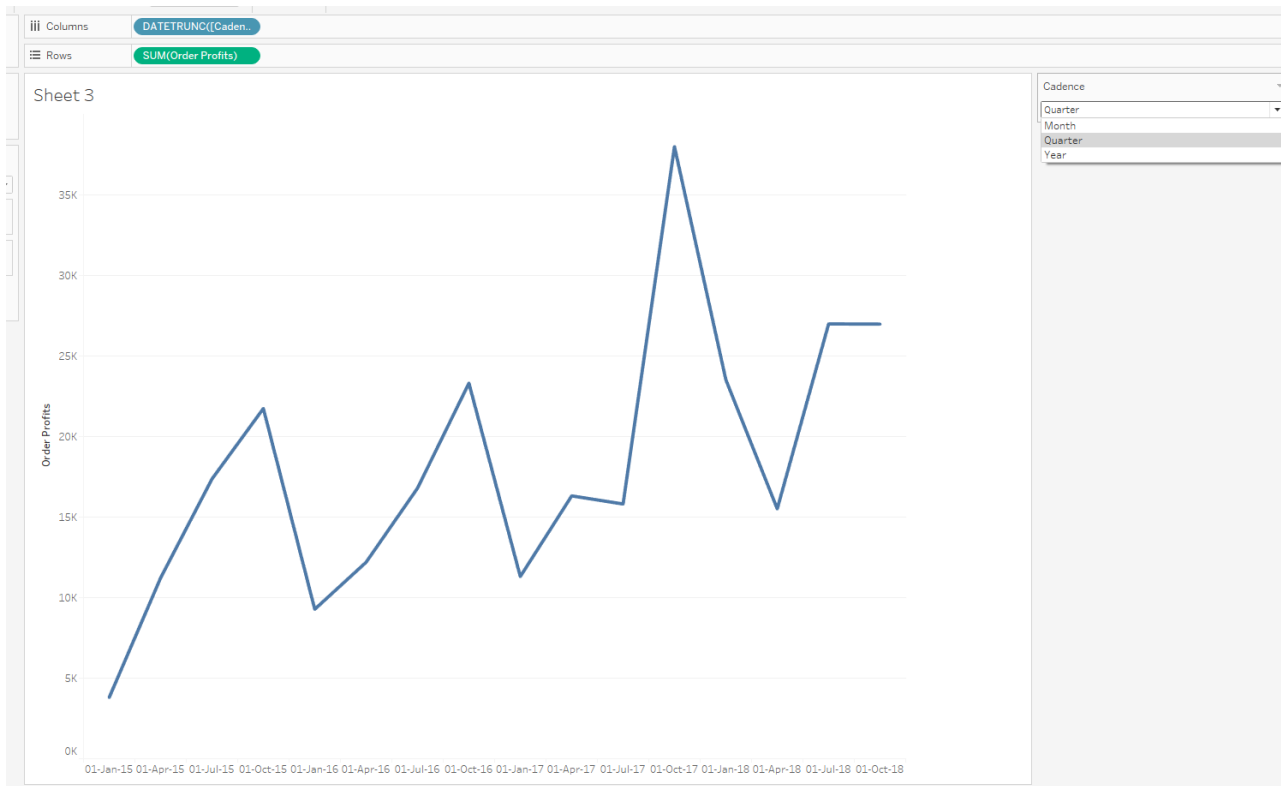

Step 3. Create a chart, your new calculated field can be used as a dimension on its own or for Color

When you change via the filter – it would change in the chart as well, but technically it would be the same chart:

The same thing can be done with Metrics and even dates – in case you want a user to be able to choose the level of detail:

On this chart everything is interactive: we choose dimension by which we show the data, metrics which we sum and the level of detail of the date axis. The name changes automatically according to the filter selections:

Adding a total line to line charts

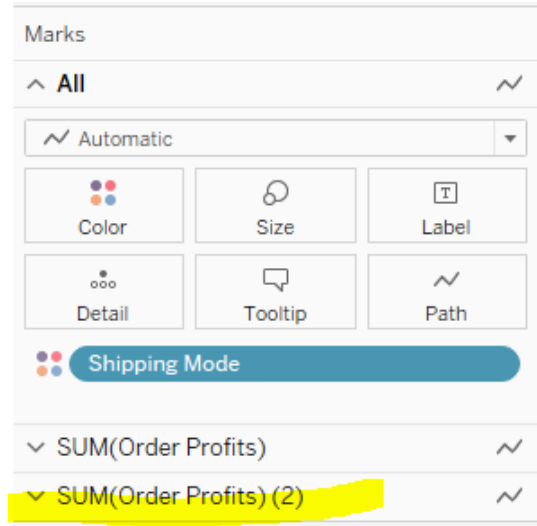

Order Date – per year

Step 1. Drag exactly the same metric next to the existing one:

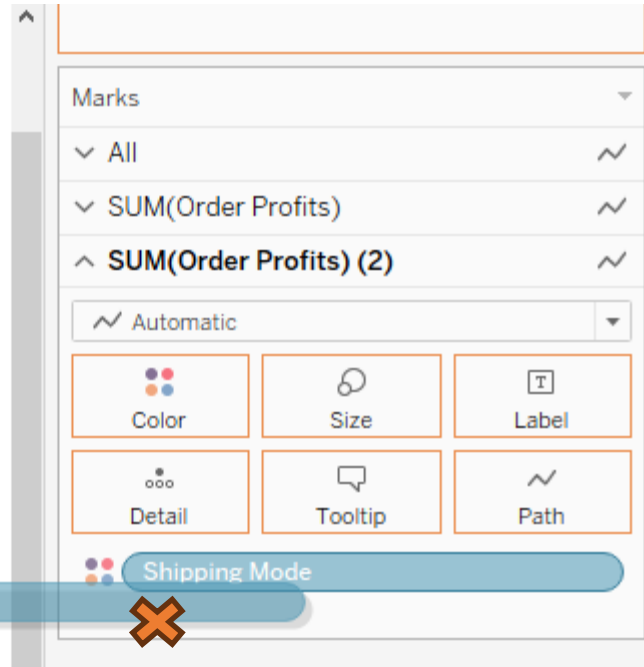

You end up with 2 charts which look the same on top of each other and 2 toolbars.

Step 2. Remove the shipping mode from our newly added chart

Customer Segment
Dimension Choice
Order Date
Order Details Id
Order Id
Order Id 1
Order Sales
Product Category
Product Id
Product Id 1
Product Manufacturer
Product Manufacturer Set
Product Name
Product Subcategory
Quantity
Shipping Date

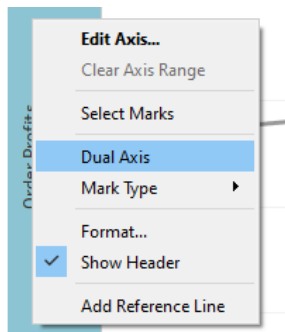

You end up with a proper chart by shipping mode + the total line:

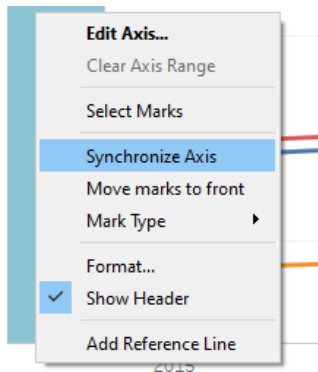

Step 3. Unite them into one chart:

- Right-click the Profit axis, select Dual Axis:

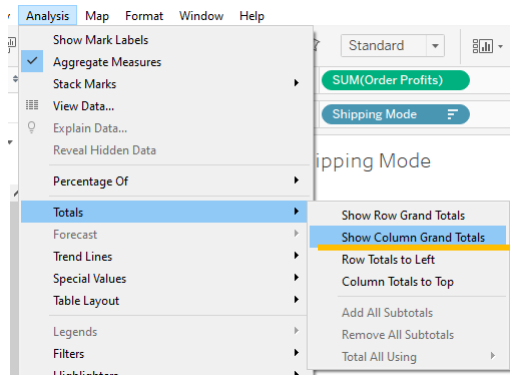

- Right-click the Profit axis one more time, select Synchronize Axis

Step 4. Make your new total line more noticeable

FUN FACT: You don't need all that hustle to add totals to a bar chart, for example, it only requires this:

Columns	SUM(Order Profits)
Rows	Shipping Mode

Profit by Shipping Mode

Creating “Others” category and sorting it

We have 17 product subcategories in our data.

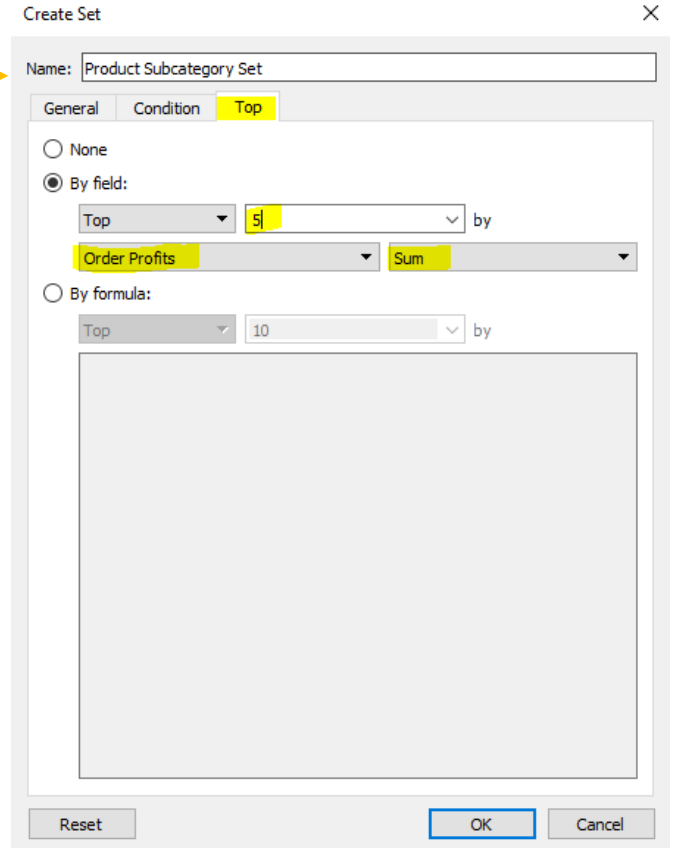

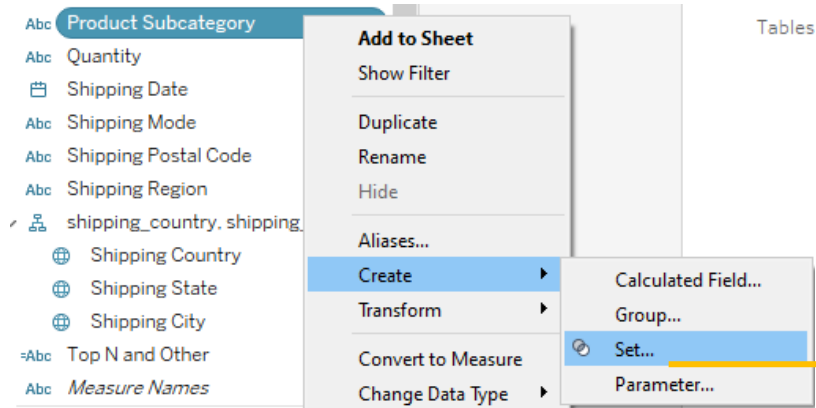

We get a request from management to create a bar chart which would show only top 5 subcategories by profit and the rest would be wrapped into “Others”. We should show it the last in our chart.

Produ..	
Copiers	55,618
Phones	44,492
Accessories	43,240
Paper	34,147
Binders	30,234
Chairs	27,163
Storage	20,806
Appliances	18,857
Furnishings	12,904
Envelopes	6,956
Labels	6,891
Art	6,530
Machines	3,387
Fasteners	1,130
Supplies	-1,187
Bookcases	-3,479
Tables	-17,733

Top 5 shown as is

Others

Step 1. Right click Product Subcategory → Create Set

Step 2. Create a Calculated field which would use the new Set:

Top N and Other

×

```
IF [Product Subcategory Set] THEN [Product Subcategory] ELSE 'Others' END
```

▶

The calculation is valid.

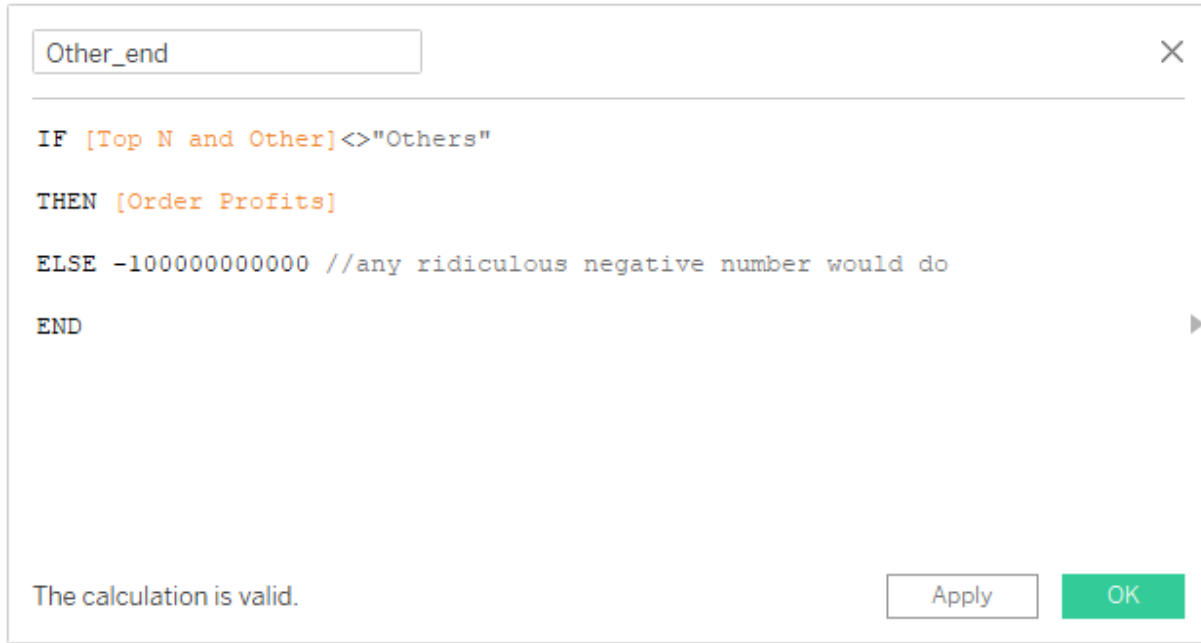

Apply

OK

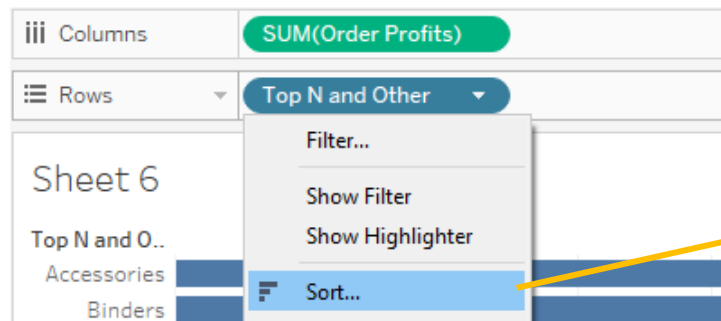

Step 3. Create a Bar chart using the new Calculated field “Top N and Other”

Step 4. Create a Calculated field which we would later use for sorting purposes to make sure the “Others” category would always appear last:

Step 5. Sort:

Sort [Top N and Other] ×

Sort By
Field ▼

Sort Order
☐ Ascending
☒ **Descending**

Field Name
Other_end ▼

Aggregation
Sum ▼

↺ Clear

“Others” is at the end of the bar chart!

Columns	SUM(Order Profits)
Rows	Top N and Other

Sheet 6

Top N ..

Thank you for your
attention!
